--- SUBCELLULAR LOCATION: Integral membrane protein. Inner membrane.
--- SIMILARITY: TO CIT IN TN3411 AND PWR60 FOUND IN E.COLI AND TO CIT IN CITROBACTER AMLONATICUS.
--- SIMILARITY: Belongs to the sugar transporter family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           "Carbamate kinase from Enterococcus faecalis and Enterococcus faecium. Cloning of the genes, studies on the enzyme expressed in Escherichia coli, and sequence similarity with N-acetyl-L-glutamate kinase."; Eur. J. Biochem. 253:280-291(1998)
                                                                                                                                                                                                                                                                                                                                                                                                                                   Submitted (MAY-1998) to the EWBL/GenBank/DDBJ databases.
-!- FUNCTION: THIS PROTEIN IS A POSITIVE REGULATOR OF GENE EXPRESSION
-!- FUNCTION: ALCTAMASE (AMPC).
-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-!- SIMILARITY: Contains 1 HTH lysR-type DNA-binding domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ARCI_ENTRA STANDARD; PRT; 309 AA.

Bacteriol. 180:4154-4159(1998).

-!- FUNCTION: Catalyzes an electroneutral exchange between arginine and ornithine to allow high-efficiency energy conversion in the arginine deiminase pathway (By similarity).

-!- SUBCELLIAR LOCATION: Integral membrane protein (Potential).

-!- SIMILARITY: Belongs to the amino acid permease family.

ArcD/cadB/lysI subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                     ;

Natl. Acad. Sci. U.S.A. 99:996-1001(2002).
-!- FUNCTION: Catalyzes an electroneutral exchange between arginine and ornithine to allow high-efficiency energy conversion in the arginine deiminase pathway (By similarity).
-!- SUBCRITULAR LOCATION: Integral membrane protein (Potential).
-!- SINGRITY: Belongs to the amino acid permease family.
ArcD/cadB/lys! subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          STRAIN=13 / Type A, bubmed=11792842; bubbilnus=21664373; bubmed=11792842; bibmizu T., Ohtani K., Hirakawa H., Ohshima K., Yamashita A., Shiba T., Ogasawara N., Hattori M., Kuhara S., Hayashi H.; "Complete genome sequence of Clostridium perfringens, an anaerobic

Mol. Biol. 224:639-657(1992).

-I- FUNCTION: This colicin is a channel-forming colicin. This class of transmembrane toxins depolarize the cytoplasmic membrane, leading to dissipation of cellular energy.
-I- FUNCTION: COLICINS ARE POLYPERTIDE TOXINS PRODUCED BY AND ACTIVE AGAINST. ESCHERICHIA COLI AND CLOSELY RELATED BACTERIA.
-I- SIMILARITY: Belongs to the channel forming colicin family.

Sequence of the phosphoenolpyruvate carboxykinase-encoding cDNA from "Sequence of the phosphoenolpyruvate carboxykinase-encoding converse the runen anaerobic fungus Neocallimastix frontalis: comparison of the amino as sequence with animals and yeast.";

Gene 110:57-63 (1992).

-! - CATALYTIC ACTIVITY: GTP + oxaloacetate = GDP + phosphoenolpyruvate

    + CO(2).
    -!- ATHWAY: Rate-limiting gluconeogenic enzyme.
    -!- SIMILARITY: Belongs to the phosphoenolpyruvate carboxykinase [GTP] family.

                                                                                                                                      (Phosphoenolpyruvate carboxylase) (PEPCK).
Neocallimastix frontalis (Rumen fungus).
Eukaryota; Fungi; Chytridiomycota; Neocallimasticales;
Neocallimasticaceae; Neocallimastix.

                                                                                                              L-aspartate and L-malate.
-!- PATHARY: Tricarboxylic acid cycle.
-!- SUBUNIT: Honoterramer.
-!- MISCELLANEOUS: The optimum temperature for activity is 75 degrees Celsius. The enzyme exhibits a pH optimum of 8.0.
-!- SIMILARITY: Belongs to the PEPCase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Bacyens W., Scheel P.O., Nies D.H.;
Schmitted (JUN-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: HAS A LOW CATION TRANSPORT ACTIVITY FOR CO(2+), IT IS
BESSENTALE FOR THE EXPRESSION OF COBALT, ZNIC, AND CADMIUM
RESISTANCE. CZCA AND CZCB TOGETHER WOULD ACT IN ZN(2+) EFFLUX
NEARLY AS EFFECTIVELY AS THE COMPLETE CZC EFFLUX SYSTEM (CZCABC)
-!- SOBCELLULAR LOCATION: Integral membrane protein (Probable).
-!- INDUCTION: By cadmium, copper and zinc.
-!- SIMILARITY: BELONGS TO THE ACRE/ACRD/ACRF FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Cell receptor specific antibodies useful for treating e.g. arthritis, diabetes, multiple sclerosis and psoriasis.

Claim 1; Page 40; 81pp; English

This sequence represents complementarity determinating region 1 (CDR H1) of the heavy chain of murine anti-CD23 (FCBRII) monoclonal antibody C11 (see also AAY32253). The invention provides altered antibodies, such as chiencic or humanised antibodies, which comprise sufficient of the amino acid sequences of C11 light and heavy chain CDRs (see AAY32254-59) to

~

```
render them capable of binding to the CD23 type II molecule expressed on haematopoietic cells. The antibodies are used to block soluble CD23 formation for treatment of arthritis, lupus eryhematosus. Hashimoto's thyroiditis, multiple sclerosis, diabetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic syndrome, glomerulonephritis, frianmatory bowel disease, ulcerative colitis, Crohn's disease, Sjogren's syndrome, allergies, allergic asthma, intrinsic asthma authentic exacerbation, rhinitis, eczema, graft-versus-host disease, (OPD), insulitis, bronchitis (particularly chronic bronchitis) or diabetes are also useful for studying interactions between CD23 and various ligands and determining the binding agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CD23; FCERII; IgE receptor; monoclonal antibody; CII; mouse; monoclonal antibody; chimeric antibody; humanised antibody; complementarity determining region, CDR; autoimmune disease; inflammation; arthritis; lupus erythematosus; multiple sclerosis; Hashimoto's thyroiditis; lupus erythematosus; multiple sclerosis; Hashimoto's thyroiditis; diabetes; uveitis; dermatitis; psoriasis; urticaria, nephrotic syndrome; glomerulonephritis; inflammatory bowel disease; ulcerative colitis; Crohn's disease; slogrem's syndrome; allergy; asthma; rhinitis; eczema; insulitis; graft-versus-host disease; COPD; bronchitis; diabetes; B-cell malignancy;

This sequence represents the heavy chain variable region (VH) of murine anti-CD23 (FCERII) monoclonal antibody C11. The invention provides anti-CD23 (FCERII) monoclonal antibody C11. The invention provides carefront and havales, such as chimeric or humanised antibodies, such as chimeric or humanised antibodies (see AAY32263), which comprise sufficient of the amino acid sequences of the C11 light and heavy chain complementarity determining regions (see AAY32254-59) to render them capable of binding to the CD23 type II molecule expressed on hamancopietic cells. The antibodies are used to block soluble CD23 formation in human therapy, for the treatment of arthritis, lupus erythematicus, Hashimoto's thyroiditis, multiple of arthritis, lupus erythematics, dermatics, sporiasis, urticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, Siggren's syndrom, allergies althma, acute asthmatic exacerbation, rhinitis, eczema, graftvorintrinsic asthma, acute asthmatics, bronchitis (particularly chronic bronchitis) or diabetes (particularly type I diabetes), and Brcell mallignancies (claimed). They are also useful for studying interactions between CD23 and various ligands and determining the binding agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

The oligonucleotides may be used for analysis of SNPs among barley
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Barley; single nucleotide polymorphism; SNP; genotype-phenotype analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The present invention relates to oligonucleotide clones originating in barley (Hordeum vulgare) which contain single nucleotide polymorphisms (SNP). The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an oligonucleotide clone sequence featured in the specification. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

CHSIGKVII) and the heavy chain complementarity determining regions (see AA732257-59) of murine antibody CII. The DNA was constructed by splice overlap PCR. The invention provides altered antibodies, which comprises sufficient of the amino acid or humanised antibodies, which comprise sufficient of the amino acid sequences of the CII light and heavy chain complementarity determining regions to render them capable of binding to the CD31 type II molecule expressed on haematopoletic cells. The antibodies are used to block soluble CD33 formation in human therapy, for the treatment of arthritis, lupus erythematosus, Hashimoto's throiditis, multiple sclerosis, calabetes, uvertis, dermatitis, psoriasis, utticaria, nephrotic syndrome, complementolomphritis, inflammatory bowel disease, ulcerative colitis, crown, s disease, Sjogren's syndrome, allergic asthma, acute asthmatic exacerbation, thinitis, eczema, graftcores. Oversus-host disease, COPD, insulitis, bronchitis (particularly type I diabetes) and B-cell malignancies (claimed). geneg

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737- $\mathbf{x}_{\mathsf{C}} \mathbf{x}_{\mathsf{C}} \mathbf{x}$

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain recarbinates, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed city control in gene therapy techniques to restore normal activity of (II) are to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. Abg00010-Ab330377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at

monoclonal antibody SM-3 which recognises a specific polymorphic epithelial mucin tumour antigen found on human breast cancer cells. The ebithelial mucin tumour antigen found on human breast cancer cells. The abtides are identified from random peptide libraries using specific ligand binding. Abtides minic the binding specificity of large molecules such as antibodies and receptors but have a much smaller size allowing timmunogenicity aiding in vivo delivery. The abbides are useful for the diagnosis, detection, imaging and treatment of disease, e.g. tumours, prostate cancer and breast cancer

The present invention relates to novel human secreted proteins (ABR47633-CC ABR48145) and their coding sequences (ACC50344-ACC50856). The proteins and their coding sequences (ACC50344-ACC50856). The proteins cor pharmaceutical composition for diagnosing or treating a cardiovascular disorder; arteriosclerosis and myocardial ischaemia), neural disorders, immune system disorders, misorders, pulmonary disorders, reproductive disorders, immune gastrointestinal disorders, pulmonary disorders, renal disorders, immune proliferative disorders and/or cancerous diseases and conditions, for commenced and entire and proliferation, to treat inflammation or infection, for treating thrombosis and arteriosclerosis, for treating or preventing neural damage which occurs in neuronal disorders or neurodegenerative conditions such as Alzheimer's disease and parkinson's disease, to enhance bone and periodontal regeneration and aid in tissue cransplants or bone grafte, to prevent skin aging or hair loss, to transplants or bone grafte, to prevent skin aging or hair loss, to crans before transplantation of haematopoietic cells and bone carrow calls when used in combination with other cytokines, to maintain organs before transplantation or for supporting cell culture of primary tissues, to increase or decrease differentiation or proliferation of embryonic stem cells, or to modulate mammalian characteristics or metabolism. Note: The sequence data for this patent was published in celectronic format and is available from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel human secreted proteins, useful for detecting, preventing, diagnosing, prognosticating, treating and/or ameliorating cardiovascular disorders such as arrhythmia.
                                                                                                                                                                       Cardiant; antiarrhythmic; antiarteriosclerotic; vasotropic; cytostatic; vulnerary; antiinflammatory; nootropic; neuroprotective; antiparkinsonian; gene therapy; human; cardiovascular disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

Drotein genes, and ABP00011-ABP00299 represent the proteins they encode.

ABZ71190-ABZ71478 represent cDNAs corresponding to 178 human secreted

Drotein genes, and ABP00011-ABP00299 represent the proteins they encode.

ABZ711540 represent human secreted proteins they encode.

Convention also encompasses antibodies specific for the secreted proteins.

The use of the secreted proteins in drug screening, and recombinant vectors and host cells comparising a mucleic acid of the invention. The secreted proteins, nucleic acids encoding them, antibodies or antibody fragments specific for the secreted proteins, and modulators of protein activity are useful for diagnosing, treating, ameliorating or preventing activity are useful for diagnosing, treating, ameliorating or preventing of sophagus, stomach, small intestine, large intestine, liver, billary treatment of immune disorders in flammation, infection, oscophagus, stomach, and include cancers of these organs and tissues. The recented proteins and their mucleic acids may also be used in the treatment of immune disorders, inflammation, infection, hyperproliferative disorders, and to promote wound healing. Nucleic acids of the invention may be used for chromosome identification, chromosome mapping, in gene therapy, for identifying individuals from minute propers. The present sequence represents a human secreted protein of the invention.
                                                                                                                                                                                              Human, secreted protein; digestive disorder, gastrointestinal disorder, mouth, oesophagus; stomach, small intestine, large intestine, liver; billary tract, pancreas, cancer; tumour; hyperproliferative disorder; immune disorder; inflammation; hyperciton, wound healing; drug screening; chromosome identification, chromosome mapping, cytostatic; gene therapy; antiinflammatory; immunosuppressive; vulnerary; chromosome 3p25.2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New human secreted proteins and nucleic acids, useful for detecting, preventing, diagnosing, prognosticating, treating and/or ameliorating e.g. gastrointestinal diseases and disorders, or cancers.
                                                                                                                                                         Human gene 139 encoded secreted protein HPRAL78, SEQ ID NO:560.

The invention relates to isolated nucleic acid molecules ADB91065-ADB91448 and ADB91835-ADB91911 encoding human secreted proteins ADB91449.

ADB91448 and ADB91835-ADB91911 encoding human secreted proteins ADB91449-ADB91449.

ADB91344. Also disclosed is a recombinant vector comprising a pulparate of the invention, and a recombinant host cell comprising the recombinant vector. The polypeptide of the invention is useful in identifying a binding partner by contacting the polypeptide with a binding partner, and determining whether the binding partner increases or decreases activity of the polypeptide. The polypeptide, polynucleotide, antibody or its fragment, agonist or antagonist are useful for preparing a pharmaceutical composition for diagnosing or treating diabetes or conditions related to diabetes. The present sequence is that of the human immunoglobulin Fc portion used to generate fusion proteins, increasing the stability of the fused protein as compared to the secreted protein only. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid encoding a human secreted protein is useful in diagnosing or treating diabetes or conditions related to diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                      Homo sapiens.
                                                                                                                                                                                                             08-MAY-2003.
                                                                                                                                                                                                                                                                                                                                                   Rosen CA,
```

The invention relates to a novel human secreted polypeptide comprising a defined sequence given in the specification. The polypeptide, nucleic acid molecule, antibody, agonist or antagonist of the invention may be useful for preparing a composition for diagnosing or treating a haematologic disorder such as anaemia, autoimmune disorders such as rhemmation, farave's disease, disorders such as rhemmation, farave's disease, controlled arthritis, inflammation, farave's disease, neurodegenerative disorders including Parkinson's disease and Alzheimer's disease, wounds and hyperproliferative disorders including atherosclerosis or cancer, as well as bacterial, viral, fungal or parasitic infections. The polypeptide may also be used during gene therapy procedures and for identifying a binding partner by contacting the polypeptide with a binding partner and determining whether the binding partner increases or decreases the activity of the polypeptide. invention.

WPI; 1999-190160/16. N-PSDB; AAX37438. New isolated human genes and the secreted polypeptides they encode useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders.

Claim 1b; Page 264; 280pp; English.

This invention describes novel isolated human secreted proteins and their encoding nucleic acid sequences. The products of the invention are useful for preventing, treating or amaliorating medical conditions es.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the presence or absence of mutations in the new polymucleotides. Specific uses are described for each of the 70 polymucleotides. Specific uses are described for each of the 70 polymucleotides based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and foctal deficiencies, blood disorders, leukemias, diseases of the inflammation, allergies, asthma, sepsis, diabetes, Alzheimer's and cognitive disorders schizophrenia osteoporosis, arthritis, psoriasis, inflammation, allergies, infections and renal disease, lymphomas, of dispessive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/enclassive/

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAY34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see AAX91990) of Chlamydia pneumoniae. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae. The invention relates to novel isolated polypeptides (1), and

C polymucleotides (II). (II) and the antibody to (I) are useful for

C diagnosing, preventing and treating diseases including immune system

disorders (e.g. congenital and acquired immunodeficiencies, autoimmune

disorders (e.g. rongenital arthritis), inflammatory conditions, organ

transplant rejections and graft versus host disease, infectious diseases

CC (e.g. hepatitis C), bleeding disorders, haemoglobin abnormalities and

cher blood-related disorders (sickle cell anaemia), myeloproliferative

cother blood-related disorders (sickle cell anaemia), myeloproliferative

CC quench: disease, Parkinson's disease), hyperproliferative disorders

CC Alzheimer's disease, Parkinson's disease), chromosomal abnormalities

CC Alzheimer's disease, Parkinson's disease), chromosomal disorders (e.g.

Chown syndrome), ischaemic injury (e.g. stroke), renal disorders (e.g.

Glomerulorephritis), cardiovascular disorders (e.g. arrhythmia),

crepiratory disorders, dermatological disorders (e.g. Addison's

clinflammatory disorders, liver disorders, gastrointestinal disorder

C (inflammatory disorders), liver disorders (cirrhosis), as stimulators of

B-cell responsiveness to pathogens, activators of T-cells, to induce

CC higher affinity antibodies, and as a means to induce tumour proliferation

chapter affinity antibodies, and as a means to induce tumour proliferation

chapter affinity antibodies, and as a means to induce (unour proliferation

chapter affinity antibodies, and as a means to induce (myours)

Publication No. US20040006218A1
GENERAL INFORMATION:
FILE OF INVENTION: Chlamydia pneumoniae genomic sequence and polypeptides, fragments
TITLE OF INVENTION: Thereof and uses thereof, in particular for the diagnosis, prevering PTILE OF INVENTION: and treatment of infection
FILE REFERENCE: 9710-003-999
CURRENT APPLICATION WOMBER: US/10/289,762
CURRENT FILING DATE: 2003-03-27
NUMBER OF SEQ ID NOS: 6849
APPLICANT: Zhou, Yihua
APPLICANT: Cao, Yongwei
TITLE OF INVENTION: Nucleic Acid Molecules and Other Molecules Associated With
TITLE OF INVENTION: Plants and Uses Thereof For Plant Improvement
TITLE OF INVENTION: Plants and Uses Thereof For Plant Improvement
CURRENT APPLICATION NUMBER: US/10/767,701
CURRENT FILING DATE: 2004-01-29
SEQ ID NOS: 63128
LENGTH: 95

Sequence 900, Application US/09198452A
Patent No. 655924
GENERAL INFORMATION:
TITLE OF INVENTION: Chlamydia pneumoniae genomic sequence and polypeptides, fragments
TITLE OF INVENTION: thereof and uses thereof, in particular for the diagnosis, prever
TITLE OF INVENTION: and treatment of infection
FILE PERERENCE: 9710-003-999
FILE PERERENCE: 9710-003-999

                                                                                                                                                                                                                                                                                                 Sequence 6029, Application US/09134000C

Patent No. 6617156
GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO
TITLE OF INVENTION: ENTERCOCCCUS FAECALIS FOR DIAGNOSTICS AND THERAPEUTICS
FILE REPERENCE: 032796-032
CURRENT RILING DATE: 1998-08-13
PRIOR APPLICATION NUMBER: US 60/055,778
PRIOR APPLICATION NUMBER: US 60/055,778
PRIOR FILING DATE: 1997-08-15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0;

Sequence 20063, Application US/09252991A
Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: AGRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS.
TITLE OF INVENTION: AGRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS.
FILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR PILING DATE: 1999-02-18
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
LENGTH: 396
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 11

A;Title: Heavy-chain variable-region sequence from an inulin-binding myeloma protein. A;Feference number: A90400, MUID:77134726; PMID:402936
A;Accession: A90400
A;Molecule type: protein
A;Residues: 1-113 <VRA>
C;Comment: This chain was isolated from a myeloma protein that binds inulin.
C;Superfamily: immunoglobulin V region; immunoglobulin homology
C;Keywords: heterotetramer; immunoglobulin nomology
F;15-100/Domain: immunoglobulin predicted

Immunoglobulin heavy chains from anti-inulin myeloma proteins:

To vidence for a new heavy chain joining segment.";

U. Immunol. 127:191-194(1981).

SINDELIANEOUS: THIS CHAIN WAS ISOLATED FROM A MYELOMA PROTEIN THAT BINDS INULIN:

-I- MISCELLANEOUS: THIS CHAIN WAS ISOLATED FROM A MYELOMA PROTEIN THAT BINDS INULIN:

C-I- SIMILARITY: Contains 1 immunoglobulin-like domain.
